Home > Flux Cloud > How to whitelist a Docker Namespace for Flux Cloud deployments

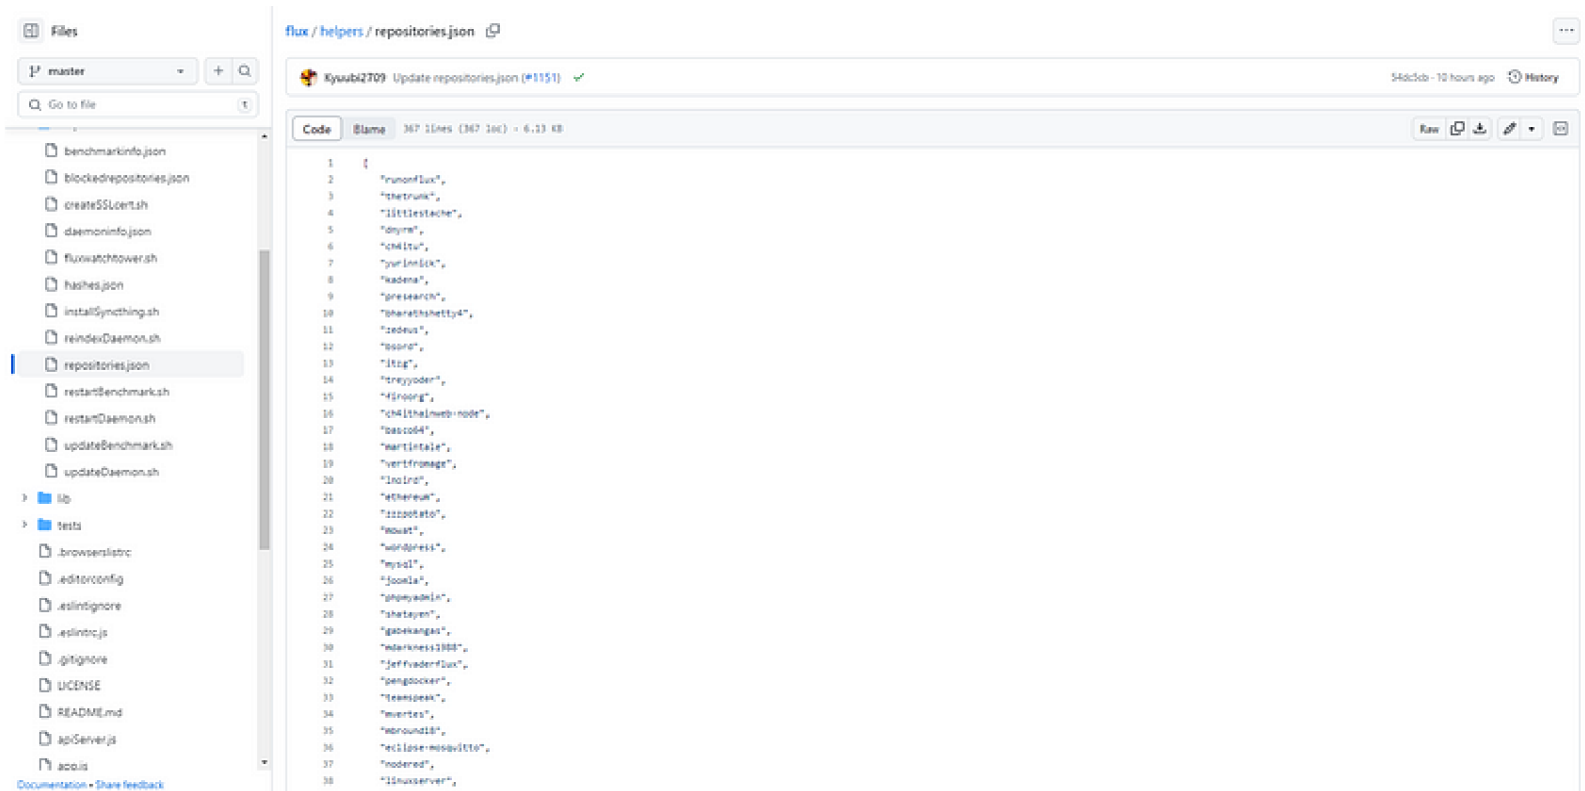

How to whitelist a Docker Namespace for Flux Cloud deployments

- Visit our GitHub page at runonflux and check the pinned repository at [RunOnFlux/flux](https://github.com/runonflux/flux).

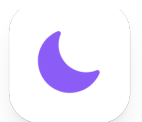

The screenshot shows the GitHub repository page for `RunOnFlux / flux`. The repository is public and has 4,897 commits, 201 stars, and 25 watchers. The repository structure is listed on the left, showing folders like `.github`, `HomeUI`, `ZelApps`, `ZelBack`, `appvolumes`, `certs`, `config`, `docs`, `helpers`, `lib`, `tests`, `.browserslistrc`, `.editorconfig`, `.eslintignore`, `.eslintrc.js`, `.gitignore`, and `LICENSE`. The `helpers` folder is highlighted, and the `repositories.json` file is visible within it. The repository is described as "Flux, Your Gateway to a Decentralized World" and includes links to the home page, API, docs, source, and wiki.

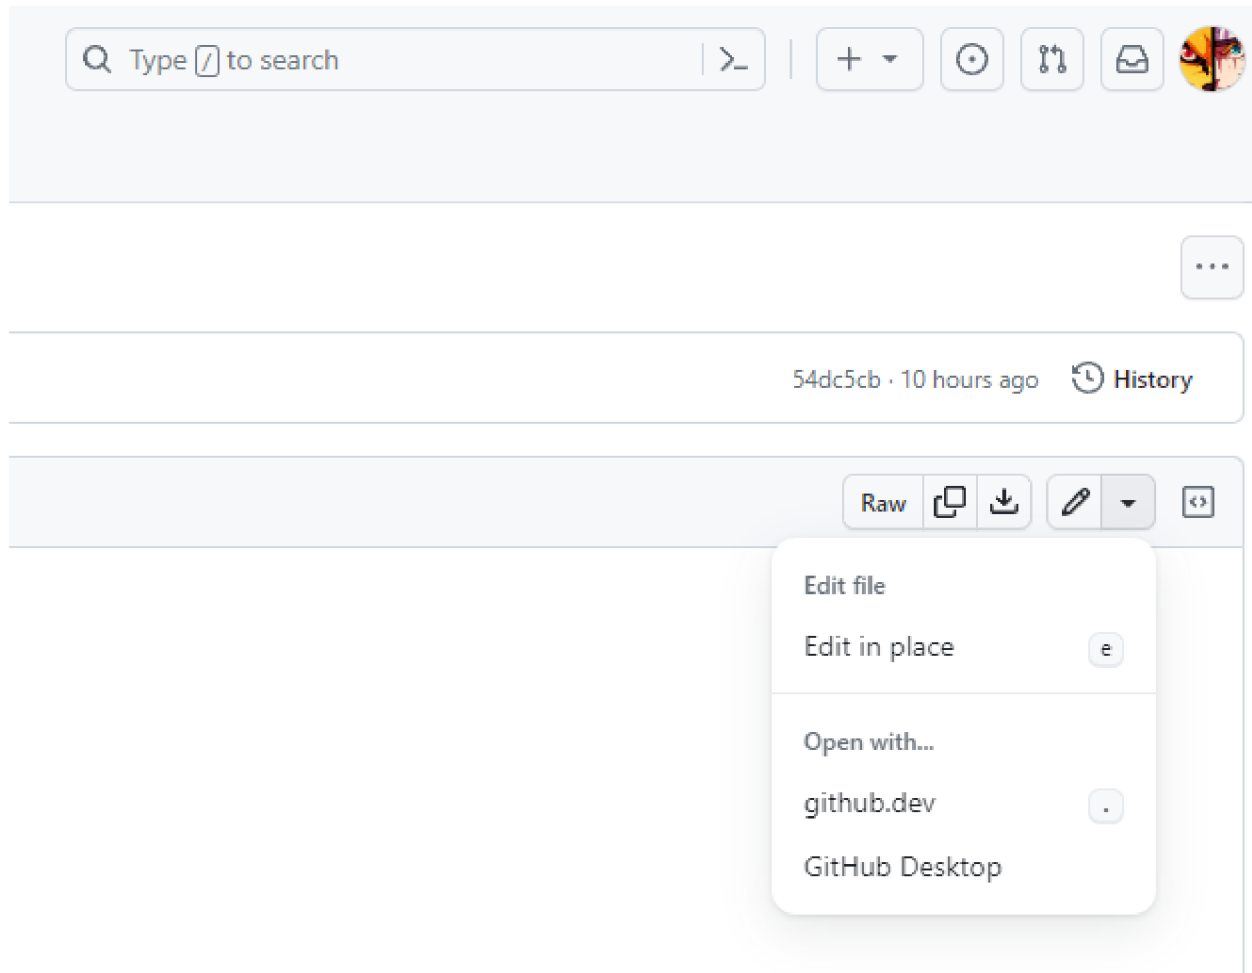

- Navigate to the “helpers” folder and then access “repositories.json.” You will encounter something similar to this:

```
1 {
2   "runonflux",
3   "hettrunk",
4   "littletache",
5   "dmyre",
6   "chilts",
7   "jynlinix",
8   "hadena",
9   "presearch",
10  "bharathshetty4",
11  "adeus",
12  "asora",
13  "lktg",
14  "trayyoder",
15  "dngong",
16  "chilthelwebnode",
17  "basco64",
18  "wartintaie",
19  "vertfromage",
20  "lnoing",
21  "etherew",
22  "tzzotato",
23  "kewat",
24  "wirdpries",
25  "myoal",
26  "foomla",
27  "ghpyadmin",
28  "sheteyen",
29  "gabekangai",
30  "mderkness1888",
31  "jeffvaderflux",
32  "pengdocker",
33  "teempeak",
34  "mvertes",
35  "abround18",
36  "ecilise-mosquittle",
37  "nodered",
38  "linuxserver",
```

- Now, let's initiate a Pull Request to add your namespace to the JSON file. Ensure that you are logged into your GitHub account to proceed.
- Click the pencil icon in the top-right menu and select "Edit in Place."

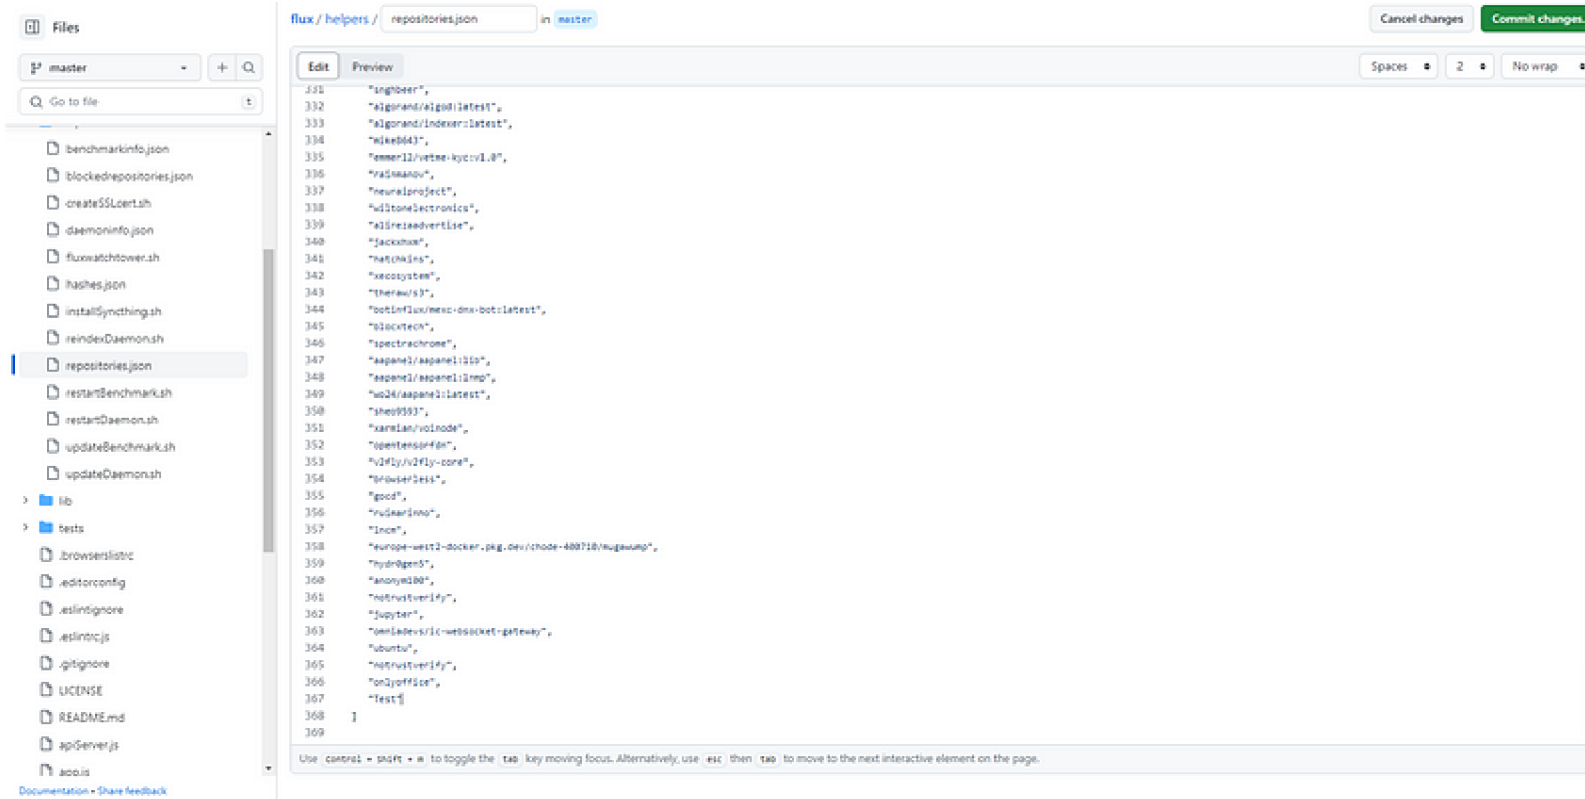

- Scroll down to the bottom of the page.
- To add your namespace, place a comma at the end of the last namespace line of code, press enter to move to the next line, and insert your namespace within double quotations. Since this is the last line of code, there is no need to add a comma here as done previously.

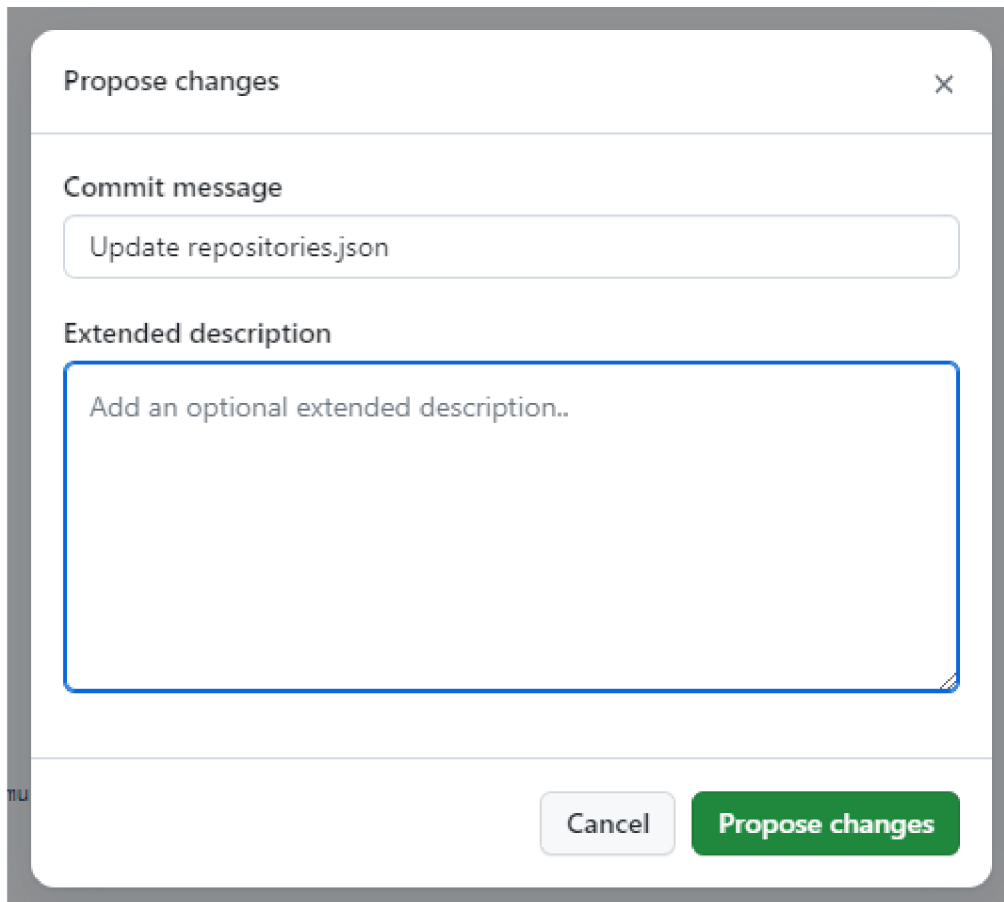

```
361     "notrustverify",
362     "jupyter",
363     "omniadevs/ic-websocket-gateway",
364     "ubuntu",
365     "notrustverify",
366     "onlyoffice"
367 ]
368
361     "notrustverify",
362     "jupyter",
363     "omniadevs/ic-websocket-gateway",
364     "ubuntu",
365     "notrustverify",
366     "onlyoffice",
367     "Test"
368 ]
369
```

- Keep in mind that certain Docker repositories require different styles. Here are some examples:
 - DockerHub: Simply put the namespace; no repository or :tag needed. Your entire namespace will be whitelisted—"runonflux."
 - GitHub Packages: You will need to put ghcr.io, the namespace, and the repository—"ghcr.io/celestiaorg/celestia-node."
 - AWS: You will need to put public.ecr.aws, the namespace, repository, and tag—"public.ecr.aws/docker/library/hello-world:linux."
- Once you have completed this, click on "Commit Changes" in the top-right corner.

- Then click on “Propose Changes.”

Application whitelist

- Whitelist is in a place acting as a first defence against malicious people that want to misuse Flux in order to for example mine cryptocurrencies or distribute illegal or copyrighted material.
- To whitelist an application for Flux, please adjust helpers/repositories.json file by adding your desired whitelist for a specific docker image organisation (recommended), docker image or target a specific tag of an image:
- Valid Examples: runonflux, runonflux/website, runonflux/websitedatest, public.ecr.aws/docker/library/hello-world:linux, ghcr.io/handshake-org/hsd
